

PROJECTPROPOSAL

PROJECTPILOT AI DISCOVERY ENGINE

Scope Architecture & Estimate: I Wanna Build

Prepared For:	hi (partner@example.com)
Business Domain:	OTHER
Target Platforms:	WEB, MOBILE
Generation Date:	July 20, 2026

1. Executive Summary

The proposed project 'I Wanna Build' is designed to serve as a high-quality other platform. Built for web, mobile, it incorporates core features including auth, dashboard. The project represents a custom software application tailored to the client's specific process. The architecture is modular, allowing features to be added, modified, and scaled over time. By focusing on clean code practices and clear separation of concerns, the application ensures high stability.

2. Project Objectives

The primary business objective is to architect and launch a scalable, secure, and production-quality software application. Through ProjectPilot AI's automated discovery session, we have analyzed requirements, selected platforms, and structured business modules to maximize engineering velocity while keeping operational expenditures low.

■ Time-to-Market	Accelerate launch cycles by using a modular, containerized stack (FastAPI & React).
■ Compliance & Security	Integrate native encryption, OAuth2 verification, and domain security mapped to other standards.
■ Future Expansion	Implement clean API separation, allowing effortless third-party integrations and smart automation additions.

3. Scope of Work & Features

The total scope covers a customized combination of standard features selected by the client, combined with intelligent additions recommended by the AI Architect based on industry standards.

Core Selected Features

- ✓ Auth
- ✓ Dashboard

AI-Recommended Enhancements

Recommended Feature	Value-Add & Purpose	Effort
Advanced Analytics Module	Custom reporting and visual data monitoring widgets.	Medium

4. Solution Architecture

The platform is structured on a modern, decoupled architecture. Client interactions happen via a responsive Single Page Application (SPA), sending secure, rate-limited requests to a high-speed async backend.

Presentation Layer	Service Layer	Persistence Layer
Vite + React SPA Framer Motion UI Responsive Design	FastAPI Async server Uvicorn Router JSON Serialization	PostgreSQL relational DB SQLAlchemy Engine Redis Cache

Technology Stack Specifications

Infrastructure Layer	Recommended Technology Stack
Frontend	React + Vite (Tailwind CSS, Framer Motion) + React Native (Expo, NativeWind) for mobile app deployment
Backend	FastAPI (Python) for API logic, Pydantic for validation, SQLAlchemy for database queries.
Database	SQLite for initial staging, migrating to PostgreSQL for production deployments.
Hosting & Infrastructure	Docker containers, deployment on Render, DigitalOcean, or AWS.
External Integrations	SendGrid for automated notifications, Google OAuth for single-sign-on (SSO).

5. Project Implementation Roadmap

Phase / Milestone	Deliverables Scope	Est. Duration
Phase 1: Foundations & User Core	- Database Schema setup - Core API configurations - User Accounts & Authentication module	2 Weeks
Phase 2: Product Core Modules	Dashboard module development	3 Weeks
Phase 3: QA, Security & Deployment	- Quality Assurance & Integration tests - Performance optimization runs - Cloud production environment deployment	1 Week

Agile Sprint Planning

Sprint	Sprint Objectives & Effort	Deliverables Checklist
Sprint 1	<i>Objectives:</i> Establish infrastructure, build base APIs, and set up landing dashboard frames. Effort: 76 Hours	- Docker infrastructure and API templates initialized - Database migrations complete and connected locally - User account registration UI & Backend logic verified
Sprint 2	<i>Objectives:</i> Complete end-to-end integration tests, resolve UI issues, and deploy to staging. Effort: 76 Hours	- Full integration unit test suite checks passing - Responsive styling issues resolved across web/mobile viewports - Continuous Integration (CI/CD) pipelines running successfully

6. Team Allocation & Budget Breakdown

Based on project parameters, the scope of selected features, and platform requirements, we have computed target effort metrics and engineered a precise allocation layout.

Total Est. Effort	Est. Timeline Duration	Engineering Team Size
153 hours	3-5 weeks	2 resources

Allocated Roles: Frontend Developer, Backend Developer

Category Component	Scope Details	Estimated Cost (USD)
UI/UX Design Phase	User experience wireframes, interactive mockup builds	\$2,295.00
Frontend Development	React / Mobile application interface construction	\$5,355.00
Backend Engineering	FastAPI endpoints, ORM connections, databases setup	\$4,590.00
Quality Assurance	End-to-end integration tests, responsiveness check	\$1,836.00
Project Management	Agile coordination, milestones, developer logs tracking	\$1,224.00
Hosting & Cloud Infrastructure	Initial VPS staging sandbox setup & pipeline actions	\$500.00
TOTAL BUDGET	Estimated total investment, excluding hosting	\$15,300.00

7. Technical Risks & Mitigations

Identified Risk Factor	Proposed Mitigation Strategy
Requirement creep during early development phase	Lock down milestone definitions and iterate in two-week agile sprint cycles.
Integration delays with legacy internal databases	Develop REST adapters and mock schemas to run parallel frontend development.
Low user adoption due to manual data migration	Create bulk CSV/JSON import scripts to migrate historic records rapidly.

8. Project Execution Next Steps

To initiate the development workflow, we recommend the following phases:

- 1. Discovery Alignment:** Conduct a developer kick-off session to align architectural preferences and integrations.
- 2. Environments Initialization:** Provision SQLite/PostgreSQL staging databases and hook continuous integration (CI) actions.
- 3. Milestone Sprint 1:** Execute Sprint 1 scope, starting with authentication configurations and dashboard scaffolding.
